21CS44

Fourth Semester B.E. Degree Examination, June/July 2023 Operating System

Time: 3 hrs.

Max. Marks: 100

Note: Answer any FIVE full questions, choosing ONE full question from each module.

Module-1

- 1 a. With neat diagram, explain :
i) Operating System ii) Dual Mode Operation in O.S. (08 Marks)
b. Explain the Operating System services with respect to programs and the users. (06 Marks)
c. What is a Process? Explain different states of a process with state diagram. (06 Marks)

OR

- 2 a. With neat diagram, explain the concept of Non virtual machine, Virtual machine and VMware architecture. (10 Marks)
b. Define : i) Context switching ii) Direct and Indirect communication
iii) Automatic and Explicit buffering. (10 Marks)

Module-2

- 3 a. What is Multithreaded process? Explain four benefits of Multithreaded programming. (06 Marks)
b. Consider the set of process with Arrival time, CPU burst time (in milliseconds) and priority shown below (Lower number represents higher priority).

Process	Arrival Time	Burst Time	Priority
P1	0	10	3
P2	1	1	1
P3	2	2	4
P4	3	1	5
P5	4	5	2

Write the Gantt chart and solve the Average waiting time and Average turnaround time for

i) SJF Scheduling (Preemptive) ii) Priority Scheduling (Preemptive).

(NOTE : Consider Arrival Time for both Algorithms).

(14 Marks)

OR

- 4 a. Explain with diagram : i) Multithreading models ii) Multilevel queue scheduling. (08 Marks)
b. What is Critical – Section? How do you implement a monitor solution to the dining – philosophers problem? (12 Marks)

Module-3

- 5 a. What is a Deadlock? What are the four necessary conditions for the deadlock to occur? (04 Marks)
b. What are the two methods to eliminate deadlock? (02 Marks)

Important Note : 1. On completing your answers, compulsorily draw diagonal cross lines on the remaining blank pages.
2. Any revealing of identification, appeal to evaluator and /or equations written eg, 42+8 = 50, will be treated as malpractice.

- c. Consider the following snapshot of a system :

Process	Allocation				Max				Available			
	A	B	C	D	A	B	C	D	A	B	C	D
P1	2	0	0	1	4	2	1	2	3	3	2	1
P2	3	1	2	1	5	2	5	2				
P3	2	1	0	3	2	3	1	6				
P4	1	3	1	2	1	4	2	4				
P5	1	4	3	2	3	6	6	5				

Answer the following using Banker's algorithm.

- Is the system is in safe state? If so, what is the safe sequence?
- If request from process P2 (0, 1, 1, 1) is considered immediately, what is the System state and Sequence?

(14 Marks)

OR

- Which are the commonly used strategies to select a free hole from the available holes? (06 Marks)
- With suitable diagram, explain external fragmentation. (04 Marks)
- With neat diagram, explain paging hardware with TLB. (10 Marks)

Module-4

- What is Demand Paging? Explain the steps in handling page fault using appropriate diagram. (10 Marks)
- Consider the page reference string : 7, 0, 1, 2, 0, 3, 0, 4, 2, 3, 0, 3, 2, 1, 2, 0, 1, 7, 0, 1 for a memory with 3 frames. Determine the number of page faults using Optimal and LRU replacement algorithms. Which algorithm is most efficient? (10 Marks)

OR

- With neat diagram, explain Two – level and Three – level directory structure. (08 Marks)
- Explain Contiguous and Linked disk space allocation methods with diagram. (12 Marks)

Module-5

- A drive has 200 cylinders 0 to 199. Head starts at 53 to serve the request queue : 98, 183, 37, 122, 14, 124, 65, 67. Draw disk head schedule diagram and explain for FCFS , SSTF, C – SCAN and C – LOCK. (12 Marks)
- How the Access matrix model of protection can be viewed in OS? (08 Marks)

OR

- With neat diagram, explain SAN and MULTICS. (08 Marks)
- Explain the components of a Linux System. (06 Marks)
- Explain in brief fork () and exec () system calls in Linux / UNIX OS, also write a program to implement these system calls in C language. (06 Marks)

To: boe@vtu.ac.in

CC: bhajan3@gmail.com

Sir,

Here mentioned course 21CS44 Operating System is not required any modification in scheme, scheme is correct & updated

Thanking you

Question Number	Solution	Marks Allocated
	<u>Virtual machine</u>  The diagram illustrates the architecture of a virtual machine. It consists of a stack of layers. At the base is 'hardware'. Above it is the 'virtual-machine implementation'. This layer supports three separate virtual machines, labeled 'VM1', 'VM2', and 'VM3'. Each VM contains its own 'kernel'. Above each kernel are 'Processes'. Arrows point from the processes down to their respective kernels, indicating the flow of execution. *> The fundamental idea behind a virtual machine is to abstract the hardware of a single computer into several different execution environment. <u>VMware architecture</u>  The diagram shows the VMware architecture. At the bottom is the 'hardware' layer, which includes 'CPU', 'memory', and 'I/O devices'. Above this is the 'host operating system (Linux)'. A 'virtualization layer' sits on top of the host OS. This layer manages three separate virtual environments. Each environment contains a 'guest OS' (BSD, Windows NT, or Windows XP) and its own set of 'Virtual CPU', 'memory', and 'devices'. 'Applications' run on top of each guest OS. Arrows show the flow from applications through the guest OS and virtualization layer down to the host OS and hardware.	④ M ④ M

Question Number	Solution	Marks Allocated
	*> VMware runs as an application on a host OS such as Windows or Linux and allows this host system to concurrently run several different guest OS's as independent virtual machines. *> Explanation of the diagram.	
2 b)	(i) <u>Context Switching</u> (ii) (iii) *> Switching the CPU to another process requires state save the current process and state restore a different process. This task is known as context switch. (ii) <u>Direct and indirect communication</u> *> In "direct communication", process must explicitly name the recipient or sender of the communication. send(P, message) - send message to process P. receive(Q, message) - Receive message from process Q. *> In "indirect communication" messages are sent to and receive from "mailboxes" or "ports". send(A, message) - send message to mailbox A. receive(A, message) - receive message from mailbox A.	10 (2+4+4) (2) M (4) M

P1	P2	P3	P4	P5	P1										
P1	P2	P1	P5	P1	P3	P4									

Question Number	Solution	Marks Allocated
4 a)	(i) <u>Multithreading models</u> (ii) Following relationship exists between user threads and kernel threads. *> <u>Many-to-One model</u>:  Only one thread can access the kernel at a time, multiple threads are unable to run in parallel on multi-processors. *> <u>One-to-One model</u>:  Maps each user thread to a kernel thread. It provides more concurrency also allows multiple threads to run in parallel on multiprocessor. *> <u>Many-to-Many model</u>:  User can create as many user threads to a smaller or equal number of kernel threads. Also the kernel can schedule another thread for execution.	8 (4+4) (4) M

Question Number	Solution	Marks Allocated
	(ii) <u>Multilevel queue scheduling</u> highest priority → system processes → → interactive processes → → interactive editing process → → batch processes → → student processes → lowest priority A multilevel queue scheduling algorithm partitions the ready queue into several separate queue based on some priority. Low priority processes are executed when no processes are in higher priority queue.	(4) M
4 b)	A system consisting of n processes $\{P_0, P_1, \dots, P_{n-1}\}$. Each process has a segment of important code called a "critical section". <pre> do { entry section critical section exit section remainder section } while (TRUE); </pre>	12 (2+10) (2) M

Question Number	Solution	Marks Allocated
	*> <u>Implementing monitor to dining-Philosopher problem.</u> <pre> monitor dp { enum { THINKING, HUNGRY, EATING } state[5]; condition self[5]; void pickup (int i) { state[i] = HUNGRY; test[i]; if (state[i] != EATING) self[i].wait(); } void putdown (int i) { state[i] = THINKING; test((i+4) % 5); test((i+1) % 5); } void test (int i) { if ((state[(i+4) % 5] != EATING) && (state[i] == HUNGRY) && (state[(i+1) % 5] != EATING)) { state[i] = EATING; self[i].signal(); } } initialization_code() { for (int i = 0; i < 5; i++) state[i] = THINKING; } } </pre>	(10) M

⊛ NOTE :- Priority is given to the above code.
(importance)

Question Number	Solution	Marks Allocated																														
5 a)	*A process requests resources; if not available, process enters waiting state, waiting process never change state because the resources it has requested are held by other waiting processes. This situation is called a "deadlock". * <u>Necessary conditions</u> (i) Mutual exclusion (ii) Hold and wait (iii) No preemption (iv) circular wait. } explanation of these.	4 (4) M																														
5 b)	* Two methods to eliminate deadlocks (i) Process termination (ii) Resource preemption } Explanation of these	(2) M

6 b)	Any suitable diagrams } $2M$ Explanation } $2M$	4																				
6 c)	The diagram shows the flow of address translation. A CPU provides a logical address to a TLB. The TLB contains entries with page numbers and frame numbers. If a TLB hit occurs, the physical address is derived and sent to physical memory. In the case of a TLB miss, the page number is used to access the page table, which maps it to a frame number. This frame number is then used to find the physical address, which is also stored back into the TLB for future hits. Physical memory is then accessed using this physical address.	10 (5+5) 5 M
